

jQuery Interests – Documentation

Jasly Delmonte

1. Purpose of the Application

This application is designed to showcase a few historical artworks that may inspire some admiration and curiosity. It reflects my personal interest in historical pieces of art and its ability to reveal timeless stories through creativity and craftsmanship. This interactive gallery not only informs users about historical masterpieces but also engages them through hover and click events, making the learning experience dynamic and informative.

2. How the Application Works

The application allows users to explore historical artworks through a dynamic and interactive gallery. Each card represents an artwork, with key details like its name, type, creator, and date. Users can interact with the gallery using:

Dropdown Menu: Users can filter artworks by type using the dropdown menu. Selecting a type dynamically updates the gallery to show only the relevant cards and provides a corresponding overview description.

Hover Events: Hover over a card to reveal a description of the artwork.

Click Events: Click on a card to toggle between its type and a fun fact, while dynamically changing its styling. Click again to revert to the original state.

Styling Changes: When users interact with a card, the styling changes (like background and border colors) to visually reinforce the interactivity, enhancing user experience.

3. Rubric

Rubric	How The Code Fulfills Criteria
Interface is Authentic, Professional, Balanced Interface design is authentic, looks professional, is balanced across the web page	The interface is authentic and professional. It features a clean, well-organized layout divided into clear sections: an introductory text, dropdown filter, gallery, and dynamic overview. The design uses consistent fonts, hover animations, and responsive grid layout, maintaining balance and aesthetic appeal across all screen sizes.
Interface links to functional jQuery jQuery is included in application source	jQuery is sourced in the HTML using <code><script src="jquery-3.7.1.js"></code> . All JavaScript functionality, including events, DOM

	manipulation and dynamic content is used with jQuery.
Events are Effective, jQuery jQuery is used to bind events to event handlers The event handling mechanism works to achieve goals.	Events are effectively bound to handlers using jQuery's .on() method. - Click Events: Toggle between displaying artwork type and fun facts on card click, with dynamic style updates for visual feedback. - Hover Events: Reveal the description of the artwork on hover. - Dropdown Change Events: Dynamically update the gallery content and overview section based on the selected filter. These interactive features meet the project's goals of user engagement and functionality.
DOM Access, jQuery The DOM is accessed with jQuery	The DOM is accessed using jQuery with selectors like #gallery, #filter, and .card. Methods like .find() are used to retrieve specific elements within a card, while .index() helps identify which card was clicked or hovered over. This precise targeting allows tailored and efficient DOM updates.
DOM Dynamically Built, jQuery The DOM is dynamically updated using jQuery calls	The DOM is dynamically updated using jQuery. The artworks array is iterated over with .forEach() to make HTML content. And cards for each artwork are appended to the #gallery using .append(). This approach makes the application scalable and flexible, allowing new artworks to be easily added.
Documentation: Program Code and Project Description .js file is fully annotated, explaining the code, not just stating that a call is being used. There is a document describing how the application works and how to use it, and the goal of the applicat	The .js file includes comments explaining sections of the code, such as the logic for toggling states, handling dropdown changes, and dynamically appending cards.
Style, jQuery In at least one instance, style is modified or applied using jQuery	Style is dynamically modified using jQuery's .css() method. For example, clicking a card changes its background and border colors to visually reinforce its toggled state. Hover effects enlarge the images slightly, providing an additional layer of interactivity and aesthetic refinement.
